EPIDEMIOLOGIC NOTES AND REPORTS

SUSPECTED CASE OF IMPORTED BUBONIC PLAGUE —
Texas

A suspected case of bubonic plague has been imported by a 21-year-old military man rotated to the United States on August 9, 1966, after a year of service in Vietnam. He first noticed a 'knot' in his left groin on August 15. He reported to a Dallas hospital on August 29 with an admission diagnosis of incarcerated inguinal hernia; however, because of suspected lymphoma, a biopsy was performed and revealed acute suppurative lymphadenitis. On September 13, 1966, a consultant suggested the possibility of plague. Subsequently, bipolar organisms were detected on a stained slide of the

lymph node and the tissue block was sent to the Walter Reed Army Institute of Research. Fluorescent antibody studies and histopathology were compatible with the diagnosis of plague. The patient was treated with streptomycin and tetracycline and he has remained afebrile since September 18.

IMPORTED CASE OF BUBONIC PLAGUE - Texas

(Continued from front page)

The serviceman has a history of immunization against plague in September 1965 and again in January 1966. Prior to returning to the United States, he had been part of a work detail to tear down old buildings which were infested with rats. Protected by heavy boots and clothing, the men engaged in contests of "stomping" the rats. The patient recalled holding a large rat by the tail.

(Reported by Dr. M.S. Dickerson, Medical Consultant, Division of Communicable Disease Control, Texas State Department of Health, Austin, Texas.)

Editorial Comment:

This case must be termed a "suspected" case of plague because confirmatory bacteriologic examinations were not performed. However, the clinical, epidemiological and laboratory findings are all completely

compatible with bubonic plague. Had this been confirmed bacteriologically, this would have been the first case of plague imported into the United States in 42 years.

The previous case occurred in October 1924 in a stowaway who was discovered suffering from an undiagnosed illness aboard a vessel which had docked in European and African Mediterranean ports. The ship arrived in New Orleans on October 28, 1924, where the man was transferred to Marine Hospital. The patient was isolated, and the diagnosis of plague was confirmed by bacteriological examination.

**CURRENT TRENDS
MEASLES - 1966**

A total of 2,581 measles cases were reported for the first 4-week period (weeks 41 through 44) of the new epidemiologic year.* This is 1,487 less than the total notified for the comparable period of 1965.

For the 44th week (ending November 5), 539 cases were reported, a decrease of 189 cases from the preceding week and a decrease of 817 cases from the comparable week in 1965. The State of Washington, however, did not

Figure 1
COUNTIES OR HEALTH DISTRICTS REPORTING MEASLES
WEEK ENDING NOVEMBER 5, 1966

report by time of publication. Of 49 reporting States, 39 recorded measles cases. Texas reported 97 cases, the highest number for the 44th week.

For the week ending October 29, 1966 (43rd week), 728 cases were reported, an increase of 93 cases over the preceding week. The 17 counties reporting 10 or more cases for the 43rd week are listed in Table 1; the geographic distribution of counties and health districts reporting measles for that week is shown in Figure 1.

(Reported by Childhood Viral Diseases Unit, Epidemiology Branch, CDC.)

*The current epidemiologic year for measles started with week 41 beginning October 9, 1966, and will close with week 40

*Reports once a month.

Saratoga County, New York

During the first week in October, five cases of measles were reported in Saratoga County from a state institution with several hundred mentally retarded patients. Consequently, a measles immunization program was conducted. Twenty-four secondary cases occurred during the week ending October 25, 1966, in patients exposed prior to the program. As of November 2, 1966, however, no further cases have been reported from the institution.

(Reported by Dr. Julia Freitag, Director, Office of Epidemiology, State of New York Department of Health.)

Madison, Maine

On October 18, 1966, a measles immunization clinic was held in Madison, Maine, a community of 2,700. Five days after the measles program four cases of measles were reported from the local grade school in which 97 preschool and 34 school children had been immunized. Consequently, the clinic was reopened and an additional 73 school children and 2 preschool children were immunized in an effort to halt further spread of the disease. (Reported by Dr. Carl H. Aurem, Health Director of Madison, Maine.)

Portland and Bangor, Maine

From November 14 through 19, 5,000 children in Portland and 2,000 in Bangor, Maine, will be immunized in city-wide measles vaccine programs. Jet injector guns will be employed in both communities.

(Reported by Dr. William Shook, Director of Public Health, Bangor, Maine; Dr. John Davy, Health Director of Portland, Maine; Dr. Dean Fisher, Commissioner, Maine Department of Health and Welfare.)

Willimantic, Connecticut

On October 12, 1966, 458 preschool children in the city of Willimantic and in the northeastern region of Connecticut were immunized with further attenuated measles virus vaccine given by jet injector gun.

(Reported by Dr. Reuben Rothblatt, Health Director of Willimantic; Dr. John Wisely, Medical Director of the Northeastern Region, Connecticut; and Dr. James Hart, Director of Preventable Diseases, Connecticut State Department of Health.)

Massachusetts

During the fiscal year 1966, the Massachusetts Division of Communicable Diseases distributed approximately 200,000 doses of further attenuated measles virus vaccine which was administered principally to preschool children. This program, in conjunction with routine immunizations in private physicians' offices, has resulted in a decrease in the number of reported measles cases. Between October 1965 and June 1966, 950 cases were notified, a 95.6 percent decrease from the 21,632 cases reported during the comparable months of the 1964-65 season.

The highest age specific rate of reported measles in Massachusetts is in the 5 to 9 year age group. A school immunization program has thus been inaugurated in order that grade school children will receive the live attenuated measles virus vaccine.

(Reported by Dr. Nicholas Fiumara, Director of Communicable Diseases, Massachusetts Department of Public Health.)

**SURVEILLANCE SUMMARY
MEASLES MORTALITY - 1965**

A preliminary estimate of 280 deaths has been attributed to measles occurring in 1965 in the United States. This total is 141 less than the 421 noted in 1964 and 84 less than the 364 recorded in 1963. Yielding an estimated death rate of 0.1 per 100,000 population, this is the lowest rate recorded since 1912, the first year of national reporting (Figure 2). The only other year in which the rate fell below 0.2 per 100,000 population was 1963.
